Retiens-tu mieux l'information selon ton profil?

Division: International

Category: Junior

Region: Chatham-Kent

City: Charing cross, ON

School: École Sainte-Catherine

Abstract: This project studied whether or not there's a relationship between a person's multiple intelligence profile and whether they retain information more efficiently either visually or orally. Profiles were collected on human subjects and then they were given a visual and oral test. Profiles were compared to visual and oral results. Initial results indicated a relationship between visual retention and profile.

Biography

I love to laugh, play soccer, be outdoors, ride my bike, walk in the woods, watch hockey, play basketball, play dodge ball and play pool with my family. I would like to pursue this science fair project in the coming years and study the same human subjects to see if there's a change in the relationship between the person's multiple intelligence profile and their ability to retain information either visually or orally. Through this project, I've discovered an interest in human brain development and the links to learning. In the future, I'd like to be able to participate in the Canada Wide Science Fair again. Some day I would maybe like to become a scientist that studies human brain development.
