The effect of different light colours on the growth of green beans

Division: Biotechnology

Category: Junior

Region: Tri-County

City: Hebron, NS

School: Maple Grove Education Centre

Abstract: I decided to grow green beans using different light colors (red, blue, green, yellow and clear). As the beans sprouted and began to grow I recorded the results. After 27 days of growing I removed the plants, with roots attached, from their buckets and recorded their growth differences.
