School: Sterling Hall School of Toronto

Abstract: Eighty-one middle-school students played 2 video games (IShootTurkey

and FruitNinja) before and after ingesting either DietCoke or caffeine-free DietCoke. Greater improvement was seen in subjects' IShootTurkey scores

after DietCoke versus caffeine-free DietCoke (114.5 vs 7; p<0.01). FruitNinja scores were not affected.The results suggest that caffeine

improves video game scores and reaction time.
