Pesticide ou peste ici?

Challenge: Environment

Category: Intermediate

Region: Western Manitoba

City: Wawanesa, MB

School: École La Source

Abstract: L'agriculture est une industrie importante et florissante au Canada. Certains processus se font naturellement. Cependant, certaines méthodes agricoles requièrent l'utilisation de pesticide pour maximiser la croissance des cultures. Mais, que ce passe-t-il lorsque la nature intervient et fait ruisser ce produit dans les différents écosystèmes? Peut-on trouver des traces de ces pesticides dans les écosystèmes environnants?

Biography

I am a grade 10 student going to Ecole La Source in Shilo, Manitoba. I am a fan of soccer, I play it all year long since I am four. I live on a farm where I help my parents. I also spend lots of time with my horse that I started to break down last fall. I found the inspiration for my project watching different farming techniques. I wanted to investigate more about friendly environmental farming procedures because I am aware of the impact of agriculture on the environment. I think doing a science project is a great way to answer your questions. By following the scientific process, you can learn all the reasoning and steps that goes with it!
