Where's The Real Beef?

Challenge: Health

Category: Junior

Region: Renfrew County

City: Pembroke, ON

School: Pine View P.S.

Abstract: "Where's the Real beef?" was a project of figuring out how much mold grew on fast food patties determining how processed they are. The burgers were left in sealed containers in a room in controlled conditions and every two days pictures were taken of the patties. After nine days of the patties molding, the results were clear.

Biography

Hello, my name is Jessica. I grew up and still live in Petawawa ON. I go to Pine View public school. I am a green belt in karate and I enjoy playing piano. I enjoy doing science, math and I absolutely love art. This is the best I have ever done in the science fair. People are always wondering what is in their food. One day I was eating a burger and then I wondered, how processed is this burger. That's how I came up with my science fair idea. A further investigation would be figuring out the difference between fast food burgers and homemade burgers. Some advice I would give to students thinking of doing a science fair project would be, come up with a unique topic. Try to be creative and informative when judging comes. Do as much research as possible and be knowledgeable of your topic.
