A Novel Method in Predicting Chronic Disease

Défi: Santé

Catégorie: Intermédiaire

Région: Cariboo Mainline

Ville: Kamloops, BC

École: Sa-hali Secondary

Sommaire: Data Mining is the practice of examining databases to generate new information. The objective, is to use data mining algorithms, on datasets derived from the Public Health Agency of Canada, and UCLA, to generate accurate predictive models, that can predict early stages of a Chronic Disease, or different features of a Chronic Disease for specific years, & implement these models in a functional mobile application.

Biographie

Rahman Tawhid is in grade 10. My interest is solving real life applications based on health and computer. I like to explore and dig in problems regardless the time spent. I've anticipated in Science Fair since 2011. I was a co-investigatior for a project on using solar energy for cooking and entered it in 2011. Another project was using a Raspberry Pi to measure the temperature inside home and controlling it outside your home. I also designed an app to cut the bill of electricity at home. I decided to focus on the health industry this year, in finding a solution to fighting Chronic Disease. I used the field of Data Mining in working with a dataset provided from the Public health Agency of Canada, and came up with predictive models to predict early stages of a certain disease or features of a disease, and put it in an app. A long term for this project is to extend this app from residential to industry. It is important to select a project that will be useful to our real life problems, it is essential that you continue in the project to enhance it as much as you can.

Prix

Valeur

Prix d'excellence - Intermédiaire - Médaille de bronze Commanditaire: Sciences jeunesse Canada	
Bourse d'études de Western University Médaille de bronze - Bourse d'admission de 1 000 \$ Commanditaire: Université Western	1 000,00 \$
Total	1 000,00 \$
