Different Growth Rates in Young-of-the-Year Mountain Whitefish in Southern Alberta

Division: Génie et sciences de l'informatique

Catégorie: Sénior

Région: Lethbridge

Ville: Lethbridge, AB

École: Winston Churchill High School

Sommaire: Fork lengths of young-of-the-year mountain whitefish from the same population, but from three different sites, in southern Alberta were compared. No statistical difference was expected. A significant difference was found with fork lengths positively related to average weekly water temperature. This suggests that environmental factors affected the rate of growth.
