Abstract: This project studied the amount of particulate matter collected at four different locations: a highway, busy main road, inner side street, and nature. Filter papers were used to measure the amounts of particles collected at each location and a microscope was used to observe them. Average amounts of particulate matter found at busy main roads compared to inner side streets were statistically the same.

Awards	Value
Honourable Mention - Health Sciences - Intermediate Sponsor: Canadian Institutes of Health Research	\$100
Total	\$100
